

## The Jagunda® Model JG-A With Auger Assembly Instructions

The Jagunda bird feeder provides complete squirrel protection when positioned 8 feet away from trees, shrubs and buildings. The 6 lb. capacity seed hopper, adjustable seed port, gravity fed, flow-through seed chamber and giant seed tray are characteristic of Droll Yankees quality and durability. Besides that, a great variety of birds love it!

### To start enjoying your new Jagunda:

1. Select a flat site 8 feet away from anything a squirrel can jump from to install the auger. The Ultimate Pole Auger consists of one auger and three 16" legs. Place the three legs on the three spokes of the auger. Hold the auger perpendicular with the auger tip on the ground. Using the legs as levers, turn the auger clockwise to screw the auger into the ground. If you hit resistance such as a rock or tree root, back it out and move the installation over by a few inches. Continue turning until the legs are flush against the ground and the installation is stable.
2. Insert Red Pole Shims into each grooved/swaged end of pole sections (new products will already have these installed). Install one of the two pole sections, grooved/ swaged end facing up, into the pole auger. Install the second pole section, open end onto the grooved/ swaged end of the first pole. Place the third pole section, which has two open ends, onto the second pole section. Tighten the thumb screw in the auger stem to keep the pole in place. The stability of the pole and auger will depend in part on the composition of your soil, if installed on uneven ground, shim the auger legs to make them level.
3. Position the Complete Clamp (CC1) on the pole at a height of four feet or more from the ground and tighten the set screw.
4. Slide the Giant Seed Tray (GS) over the pole so that it rests on the CC1.
5. Rotate the Grey Port to adjust the seed flow. When using straight sunflower, the ports can remain open or slightly closed. With a mixture that contains smaller seeds, partially close the ports to reduce waste.
6. Place the hopper on the Giant Seed Tray. Fill with seed.
7. Install Pole O-Ring by rolling it down the pole until it is level with the lip of the Hopper Body
8. Slide Collet Insert, threaded side upward, onto the pole until it rests on the Pole O-Ring
9. Place the Universal Cover over the Collet Insert, engaging the tab on the Collet Insert with the cut out slot in the Universal Cover. Adjust the Pole O-Ring if the Universal Cover is not sitting directly on the Hopper Body. Slide the Collet Knob down the pole and tighten onto the Collet Insert, securing the Universal Cover in place so that the wind cannot lift it.
10. Drop the Pole Adapter stem (ADPT) into the top of the pole. You can mount an additional feeder on the top of the pole by screwing the ADPT into the threaded base of any of our tubular or versatile feeders like the X-1, LF-4 or CC12FM. If not mounting a feeder on top, leave the ADPT in the pole to keep rainwater out.
11. Enjoy your new Jagunda bird feeder and the thousands of birds you'll see feeding from it over the years.

Bird Feeders®

Remember that to prevent the spread of disease, and to keep your feeder looking like new, the Jagunda should be disassembled and washed regularly with a mild soap solution. It can be disinfected using a 50/50 solution of white vinegar and hot water.

**Note:** To disassemble the Hopper Body and Gray Port for cleaning, turn upside down and spread the clear prongs to disengage the Gray Port.
